

**UNITED STATES DISTRICT COURT
DISTRICT OF NEW JERSEY**

PATRICIA YANETH CORNEJO
ORAHETA, *individually and in a
representative capacity on behalf of those
similarly situated,*

Plaintiff,

v.

APPLE INC.,

Defendant.

Case No. _____

CLASS ACTION COMPLAINT

JURY TRIAL DEMANDED

TABLE OF CONTENTS

| | | |
|------|---|----|
| I. | NATURE OF THE ACTION | 1 |
| II. | PARTIES | 7 |
| III. | JURISDICTION, VENUE, AND COMMERCE | 9 |
| IV. | ALLEGATIONS OF FACT SUPPORTING THE CLAIM FOR RELIEF | 10 |
| A. | Background | 10 |
| B. | The Two Relevant Markets are the Markets for the Sale of New Smartphones and New Performance Smartphones in the United States | 19 |
| 1. | Relevant Product Markets | 24 |
| a. | Performance Smartphones are a relevant product market | 24 |
| b. | Smartphones are a broader relevant product market | 25 |
| 2. | Relevant Geographic Market | 26 |
| C. | Apple Has Monopoly Power in the Relevant Markets | 27 |
| D. | Apple Unlawfully Maintains Its Monopoly Power | 30 |
| 1. | Apple harms competition by imposing contractual restrictions, fees, and taxes on app creation and distribution | 30 |
| a. | Super Apps: Apple prevented apps from threatening its Smartphone monopoly by undermining mini programs that reduce user dependence on the iPhone | 33 |
| b. | Cloud Streaming Apps: Apple prevented developers from offering cloud gaming apps that reduce dependence on the iPhone’s expensive hardware | 35 |
| 2. | Apple uses APIs and other critical access points in the Smartphone ecosystem to control the behavior and innovation of third parties in order to insulate itself from competition. | 38 |
| a. | Messaging: Apple protects its Smartphone monopoly by degrading and undermining cross-platform messaging apps and rival Smartphones | 38 |
| b. | Smartwatches: Apple protects its Smartphone monopoly by impeding the development of cross-platform smartwatches | 41 |
| c. | Digital Wallets: Apple restricts cross-platform digital wallets on the iPhone, reinforcing barriers to consumers switching to rival Smartphones | 44 |
| 3. | Apple’s “moat” around its Smartphone monopoly is wide and deep: it uses a similar playbook to maintain its monopoly through many other products and services | 48 |
| E. | Anticompetitive Effects | 51 |
| 1. | Apple’s anticompetitive conduct harms the competitive process and injured consumers | 51 |

| | | |
|-------|---|----|
| 2. | Apple has every incentive to continue to abuse its monopoly power absent court intervention. | 56 |
| 3. | There are no procompetitive benefits to Apple’s anticompetitive conduct | 57 |
| V. | CLASS ACTION ALLEGATIONS | 59 |
| VI. | CLAIMS FOR RELIEF | 61 |
| | COUNT I: MONOPOLIZATION | 61 |
| | COUNT II: ATTEMPTED MONOPOLIZATION | 63 |
| VII. | PRAYER FOR RELIEF | 64 |
| VIII. | DEMAND FOR JURY TRIAL | 65 |

When you have a monopoly market share, . . . the companies forget what it means to make great products. The product sensibility and the product genius that brought them to that monopolistic position gets rotted out by people running these companies who . . . really have no feeling in their hearts usually about wanting to really help the customers.

—*Steve Jobs, 1995*¹

Plaintiff Patricia Yaneth Cornejo Oraheta, on behalf of herself and in a representative capacity on behalf of a Class of direct purchasers of iPhones in the United States, brings claims against Defendant Apple, Inc. (“Defendant” or “Apple”), under Section 2 of the Sherman Antitrust Act of 1890, 15 U.S.C. § 2, and Sections 4 and 16 of the Clayton Antitrust Act, 15 U.S.C. §§ 15 & 26, for relief from Defendant’s attempted and actual monopolization of the market for the sale of Smartphones in the United States from at least as early as March 21, 2020, through the date by which the anticompetitive effects of its violations of law shall have ceased, but in any case no earlier than the present (the “Class Period”). Based upon personal knowledge, information and belief, the allegations made by the United States Department of Justice and the States of New Jersey, Arizona, California, Connecticut, Maine, Michigan, Minnesota, New Hampshire, New York, North Dakota, Oklahoma, Oregon, Tennessee, Vermont, Wisconsin, and the District of Columbia, and investigation of counsel, Plaintiff alleges:

I. NATURE OF THE ACTION

1. On March 21, 2024, the United States Department of Justice (“DOJ”) and a number of State Attorneys General filed what has been described as a “landmark” antitrust case against Apple. The DOJ alleges Apple monopolized the markets for Smartphones and Performance Smartphones, as defined herein. *See United States, et al. v. Apple Inc., et al.*, No.

¹ *Steve Jobs, The Lost Interview 1995* (Jon Gau Productions 2012), available at <https://tv.apple.com/us/movie/steve-jobs-the-lost-interview/umc.cmc.493j4pff910e7b61bca47x2j8?playableId=tv.sbd.9001%3A1119860107>

2:24-cv-04055 (D.N.J. Mar. 21, 2024). The DOJ and the States seek injunctive relief. Plaintiff brings this action as a private attorney general to supplement government enforcement through a private right of Action under Sections 4 and 16 of the Clayton Act to recover treble damages and other relief under federal law on behalf of consumers in the United States who purchased iPhones directly from Apple, such as at an Apple Store or the Apple website.

2. Apple's U.S. market share by revenue is over 70 percent in the Performance Smartphone market—a more expensive segment of the broader Smartphone market where Apple's own executives recognize the company competes—and over 65 percent for all Smartphones, each as further defined herein. Over the last decade, Apple increased its share of Smartphones sold in the United States most years. Through the same period, Apple collected more than half the revenue for all Smartphones sold in the United States.

3. Apple has abused and continues to abuse its monopoly through the overarching scheme revealed by the DOJ, with the purpose and the effect of charging and receiving artificially high prices and fees from consumers in the United States

4. For many years, Apple has built a dominant iPhone platform and ecosystem, driving the company's astronomical valuation. At the same time, it has long understood that disruptive technologies and innovative apps, products, and services threatened that dominance by making users less reliant on the iPhone or making it easier to switch to a non-Apple Smartphone. Rather than respond to competitive threats by offering lower Smartphone prices to consumers or better monetization for developers, Apple would meet competitive threats by imposing a series of shapeshifting rules and restrictions in its App Store guidelines and developer agreements that would allow Apple to extract higher fees, thwart innovation, offer a less secure or degraded user experience, and throttle competitive alternatives. It has deployed this playbook across many

technologies, products, and services, including super apps, text messaging, smartwatches, and digital wallets, among many others.

5. Apple's conduct also stifles new paradigms that threaten Apple's Smartphone dominance, including the cloud, which could make it easier for users to enjoy high-end functionality on a lower priced Smartphone—or make users device-agnostic altogether. Apple feared the disintermediation of its iPhone platform and undertook a course of conduct that locked in users and developers while protecting its profits.

6. Apple's anticompetitive conduct not only limits competition in the Smartphone market, but also reverberates through the industries affected by these restrictions, including financial services, fitness, gaming, social media, news media, entertainment, and more. Unless Apple's anticompetitive and exclusionary conduct is stopped, it will likely extend and entrench its iPhone monopoly to other markets and parts of the economy. For example, Apple is rapidly expanding its influence and growing its power in the automotive, content creation and entertainment, and financial services industries—often doing so in exclusionary ways, further reinforcing, and deepening the competitive moat around the iPhone.

7. In 2007, Apple launched the iPhone, a Smartphone that offered high-end hardware and software applications, called “apps,” built atop a mobile operating system that mimicked the functionality and ease of use of a computer. Apple initially offered only a small number of apps that it created for the iPhone.

8. Apple's Smartphone business model is one that invites as many participants as possible, including iPhone users and third-party developers, to join its platform while using contractual terms to force these participants to pay substantial fees. At the same time, Apple restricts its platform participants' ability to negotiate or compete down its fees through

alternative app stores, in-app payment processors, and more.

9. To protect that model, Apple reduces competition in the markets for Performance Smartphones and Smartphones generally. It does this by delaying, degrading, or outright blocking technologies that would increase competition in the Smartphone markets by decreasing barriers to switching to another Smartphone, among other things. The suppressed technologies would provide a high-quality user experience on any Smartphone, which would, in turn, require Smartphones to compete on their merits.

10. Apple suppresses such innovation through a web of contractual restrictions that it selectively enforces through its control of app distribution and its “app review” process, as well as by denying access to key points of connection between apps and the iPhone’s operating system (called Application Programming Interfaces or “APIs”). Apple can enforce these restrictions as an intermediary between product creators such as developers on the one hand and users on the other.

11. This complaint highlights five examples of Apple using these mechanisms to suppress technologies that would have increased competition among Smartphones. Suppressing these technologies does not reflect competition on the merits. Rather, to protect its Smartphone monopoly—and the extraordinary profits that monopoly generates—Apple repeatedly chooses to make its products worse for consumers to prevent competition from emerging. The examples below individually and collectively have contributed to Apple’s ability to secure, grow, and maintain its Smartphone monopoly by increasing switching costs for users, which leads to higher prices and less innovation for users and developers.

12. Apple has used one or both mechanisms (control of app distribution or control of APIs) to suppress the following technologies, among others:

Super apps provide a user with broad functionality in a single app. Super apps can improve Smartphone competition by providing a consistent user experience that can be ported across devices. Suppressing super apps harms all Smartphone users—including Apple users—by denying them access to high quality experiences and it harms developers by preventing them from innovating and selling products.

Cloud streaming game apps provide users with a way to play computing intensive games in the cloud. Cloud streaming games (and cloud streaming in general) can improve Smartphone competition by decreasing the importance of expensive hardware for accomplishing high compute tasks on a Smartphone. Suppressing cloud streaming games harms users by denying them the ability to play high-compute games, and it harms developers by preventing them from selling such games to users.

Messaging apps are apps that allow users to communicate with friends, family, and other contacts. Messaging apps that work equally well across all Smartphones can improve competition among Smartphones by allowing users to switch phones without changing the way they communicate with friends, family, and others. Apple makes third-party messaging apps on the iPhone worse generally and relative to Apple Messages, Apple's own messaging app, by prohibiting third-party apps from sending or receiving carrier-based messages. By doing so, Apple is knowingly and deliberately degrading quality, privacy, and security for its users and others who do not have iPhones. Apple also harms developers by artificially constraining the size of their user base.

Smartwatches are an expensive accessory that typically must be paired to a Smartphone. Smartwatches that can be paired with different Smartphones allow users to retain their investment in a smartwatch when switching phones thereby decreasing the literal cost associated with switching from one Smartphone to another, among other things. By suppressing key functions of third-party smartwatches—including the ability to respond to notifications and messages and to maintain consistent connections with the iPhone—Apple denied users access to high performing smartwatches with preferred styling, better user interfaces and services, or better batteries, and it has harmed smartwatch developers by decreasing their ability to innovate and sell products.

Digital wallets are an increasingly important way that Smartphones are used and are a product in which users develop a great deal of comfort and trust as they typically contain users' most sensitive information. Digital wallets that work across Smartphone platforms allow users to move from one Smartphone brand to another with decreased frictions, among other things. Apple has denied users access to digital wallets that would have provided a wide variety of enhanced features and denied digital wallet developers—often banks—the opportunity to provide advanced digital payments services to their own customers.

13. By maintaining its monopoly over Smartphones, Apple harms consumers in a

wide variety of additional ways. For example, by denying iPhone users the ability to choose their trusted banking apps as their digital wallet, Apple retains full control both over the consumer and the stream of income generated, forcing users to use only Apple-authorized products in the digital wallet. Apple also prohibits the creation and use of alternative app stores curated to reflect a consumer's preferences with respect to security, privacy, or other values. While these features, and many others are beneficial to consumers, empowering them to make choices about what Smartphone to buy and what apps and products to patronize allowing consumers to make that choice is an obstacle to Apple's ability to maintain its monopoly.

14. This is not the story Apple presents to the world. For decades, Apple branded itself a nimble, innovative upstart. In 1998, Apple co-founder Steve Jobs criticized Microsoft's monopoly and anticompetitive conduct. But even at that time, Apple did not face the same types of restrictions it imposes on third parties today; Apple users could use their iPod with a Windows computer, and Microsoft did not charge Apple a 30 percent fee for each song downloaded from Apple's iTunes store. Similarly, when Apple brought the iPhone to market in 2007, it benefited from competition among component makers and wireless carriers.

15. While Apple's anticompetitive conduct arguably has benefited its shareholders—with over \$77 billion in stock buybacks in its 2023 fiscal year alone—it comes at a great cost to consumers. Some of those costs are immediate and obvious, directly affecting Apple's own customers: Apple inflates the price for buying and using iPhones while preventing the development of features like alternative app stores, innovative super apps, cloud-streaming games, and secure texting.

16. Other costs of Apple's anticompetitive conduct may be less obvious in the immediate term, but are no less harmful and even more widespread, affecting all Smartphone

consumers. Apple's Smartphone monopoly means that it is not economically viable to invest in building some apps, like digital wallets, because they cannot reach iPhone users. This means that innovations fueled by an interest in building the best, most user-focused product that would exist in a more competitive market never get off the ground. What's more, Apple itself has less incentive to innovate because it has insulated itself from competition. Apple spent more than twice as much on stock buybacks and dividends as it did on research and development.

17. Moreover, Apple has demonstrated its ability to use its Smartphone monopoly to impose fee structures and manipulate app review, inhibiting aggrieved parties from taking advantage of regulatory and judicial solutions imposed on Apple that attempt to remedy harm from its conduct.

18. Apple wraps itself in a cloak of privacy, security, and consumer preferences to justify its anticompetitive conduct. Indeed, it spends billions on marketing and branding to promote the self-serving premise that only Apple can safeguard consumers' privacy and security interests. Yet Apple selectively compromises privacy and security interests when doing so is in Apple's own financial interest—such as degrading the security of text messages, offering governments and certain companies the chance to access more private and secure versions of app stores, or accepting billions of dollars each year for choosing Google as its default search engine when more private options are available. In the end, Apple deploys privacy and security justifications as an elastic shield that can stretch or contract to serve Apple's financial and business interests.

19. Plaintiff brings this action for redress of the substantial injuries she and members of the Class have suffered by reason of Defendant's continuing violations of law.

II. PARTIES

20. Plaintiff Patricia Yaneth Cornejo Oraheta is a resident of Suffolk County in the

State of New York.

21. During the Class Period, Plaintiff purchased an iPhone directly from Apple.

22. Plaintiff was injured in her business or property as a direct, proximate, and material result of Defendant's violations of law.

23. Plaintiff is threatened with future injury to her business and property by reason of Defendant's continuing violations of law, absent Court intervention.

24. Defendant Apple Inc. is a California corporation, organized and existing under the laws of the State of California, with its principal place of business at One Apple Park Way, Cupertino, CA 95014.

25. Apple is a monopolist in the market for the sale of Smartphones in the United States. Apple maintains a durable, entrenched, U.S. market share by revenue of over 70 percent in the Performance Smartphone market— over 65% of the broader Smartphone market. These market shares have remained remarkably durable over the last decade, in a concentrated market with only two significant competitors, neither of which has access to Apple's dominant software products and platforms, from which they and their customers are excluded. Apple has the power to both control prices and exclude competition. As a result of its anticompetitive conduct, Apple sells iPhone brand Smartphones at supracompetitive monopoly prices to consumers.

26. "Defendant" and "Apple" as used herein, refer to and include each of Apple's predecessors, successors, parents, wholly-owned or controlled subsidiaries or affiliates, employees, officers, and directors. Whenever reference is made to any act, deed, or transaction of any corporation or partnership, the allegation means that the corporation or partnership engaged in the act, deed, or transaction by or through its officers, directors, agents, employees, representatives, parent, predecessors, or successors-in-interest while they were actually engaged

in the management, direction, control, or transaction of business or affairs of the corporation or partnership.

III. JURISDICTION, VENUE, AND COMMERCE

27. This action arises under Section 2 of the Sherman Antitrust Act, 15 U.S.C. §2, Sections 4 & 16 of the Clayton Antitrust Act, 15 U.S.C. §§15 & 26, and the State laws cited herein.

28. This Court has subject matter jurisdiction under 28 U.S.C. §§ 1331, 1332(d), and 1337.

29. Venue is proper in this District under 15 U.S.C. §§ 15(a) & 22, and 28 U.S.C. § 1391(b), (c), and (d), because, during the Class Period, Defendant resided, transacted business, was found, and a substantial portion of the alleged activity affected interstate trade and commerce in this District.

30. During the Class Period, Defendant's conduct was within the flow of, was intended to, and did, in fact, have a substantial effect on the interstate commerce of the United States and its territories.

31. During the Class Period, Defendant used the instrumentalities of interstate commerce, including interstate wires, wireless spectrum, and the United States Mail, to effectuate their illegal scheme.

32. This Court has personal jurisdiction over Defendant because Defendant transacted business, maintained substantial contacts, and is located and/or committed unlawful conduct in this District. Defendant's unlawful scheme was directed at, and had the intended effect of, causing injury to persons residing in, located in, or doing business in this District.

IV. ALLEGATIONS OF FACT SUPPORTING THE CLAIM FOR RELIEF

A. Background

33. Apple is one of the world's most valuable public companies with a market capitalization over \$2.5 trillion. In fiscal year 2023, Apple generated annual net revenues of \$383 billion and net income of \$97 billion, exceeding the net income any other company in the Fortune 500 and the gross domestic products of more than one hundred countries.

34. The iPhone, Apple's signature product, is the primary driver of Apple's growth and profitability, routinely commanding profit margins of more than 30 percent on devices alone—significantly higher than its Smartphone competitors. iPhone sales have made up a majority of Apple's annual revenue every year since 2012.

35. Apple increasingly extracts revenue from iPhone users beyond the initial Smartphone sale, through iPhone upgrades, apps and in-app payments, paid digital subscription services (e.g., Apple's music streaming, TV, news, gaming, fitness, and cloud storage subscriptions), accessories (e.g., tracking devices, headphones, chargers, iPhone cases), and more. Apple refers to these offerings as "Services" and "Wearables, Home, and Accessories," respectively. In fiscal year 2023, these offerings accounted for nearly one-third of Apple's total revenue, or four times what Apple earned from selling Mac computers. Some of the largest drivers of revenue within these categories are Apple's smartwatch, the Apple Watch, and Apple's App Store, where iPhone users purchase and download apps. In recent years, Services have accounted for an increasing share of Apple's revenues, while the iPhone has remained the primary gateway through which U.S. consumers access these services.

36. Apple's U.S. market share by revenue is over 70 percent in the Performance Smartphone market and over 65 percent for all Smartphones, with each of these market shares remaining remarkably durable over the last decade.

37. Apple's Smartphone market shares understate Apple's dominance and likely growth in key demographics, including among younger American consumers. For example, one-third of all iPhone users in the United States were born after 1996, as compared to just 10 percent for Samsung, Apple's closest Smartphone competitor. Surveys show that as many as 88 percent of U.S. teenagers expect to purchase an iPhone for their next Smartphone. iPhone users also tend to come from higher income households. Because Smartphone users generally use a single Smartphone to access related products and services, locking up key user groups allows Apple to capture greater spending on iPhone-related products and services, realize higher margins per user as compared to its Smartphone rivals, and exercise greater control over developers and other Smartphone ecosystem participants.

38. In fiscal year 2023, Apple spent \$30 billion on research and development. By comparison, Apple spent \$77 billion on stock buybacks during the same year.

39. Apple was founded in 1976. During its first 25 years, the company focused in large part on producing and marketing personal computers. Although the market for personal computers expanded over the next several decades, Apple struggled to gain customer adoption for its higher-priced products relative to its lower-cost competitors, including IBM and Microsoft. In the late 1990s, Apple restructured the company and embarked on a new strategy focused not just on selling personal computers, but also consumer devices like the iPod, which led to the development of the iPhone.

40. When Apple began developing mobile consumer devices, it did so against the backdrop of *United States v. Microsoft*, which created new opportunities for innovation in areas that would become critical to the success of Apple's consumer devices and the company itself.

41. The iPod did not achieve widespread adoption until Apple developed a cross-

platform version of the iPod and iTunes for Microsoft's Windows operating system, at the time the dominant operating system for personal computers. In the absence of the consent decree in *United States v. Microsoft*, it would have been more difficult for Apple to achieve this success and ultimately launch the iPhone.

42. On May 18, 1998, the DOJ and the Attorneys General of 19 States and the District of Columbia filed *United States v. Microsoft*, an antitrust lawsuit against Microsoft alleging that the company had violated Section 2 of the Sherman Act by monopolizing the market for Intel-compatible personal computer operating systems.

43. At trial, the government successfully established that Microsoft took steps to undermine the competitive threats posed by "middleware," such as web browsers like Netscape, after recognizing that if users could use middleware to access a variety of content and services via remote servers, over the internet, they might be less reliant on Windows. Microsoft also took steps to undermine cross-platform technologies like QuickTime, a software architecture developed by Apple to play multimedia content (e.g., music and videos) on Apple's Mac computers and Microsoft's Windows PCs.

44. In April 2000, the trial court ultimately found that Microsoft's conduct violated Section 2 of the Sherman Act. An appeals court upheld the district court's findings of liability regarding middleware.

45. In January 2001, Apple introduced iTunes, software built on Apple's QuickTime architecture, and advertised it as "Jukebox Software" for organizing and listening to music. The initial version of iTunes was only compatible with Apple's Mac computers.

46. Later that same year, Apple debuted the iPod, a portable digital audio player that worked alongside iTunes. Like iTunes, initially the iPod was only compatible with Mac

computers.

47. On November 1, 2002, the trial court accepted a proposed consent decree in *United States v. Microsoft*. Among other things, the consent decree prohibited Microsoft from retaliating against companies for developing or distributing products such as browsers and media players. The consent decree also required Microsoft to make various APIs available to third-party developers, including Apple.

48. Following that consent decree in October 2003, Apple launched a cross-platform version of iTunes that was compatible with the Windows operating system. As a result, a much larger group of users could finally use the iPod and iTunes, including the iTunes Store. The iTunes Store allowed users to buy and download music and play it on their iTunes computer application or on the iPod.

49. Apple benefited substantially from this new customer base. In the first two years after launching the iPod, Apple sold a few hundred thousand devices. The year after launching a Windows-compatible version of iTunes and gaining access to millions more customers, Apple sold millions of devices, and went on to sell hundreds of millions of iPod devices over the next two decades.

50. iTunes became the market leader in online music services. At an event in 2007, Apple announced the company would change its name from Apple Computer, Inc. to Apple, Inc. in light of its shifting focus to consumer electronics rather than computers.

51. The ubiquity of iPod and iTunes on Windows, in part because of a successful antitrust enforcement action against Microsoft, contributed to the development and success of Apple's next flagship product—the iPhone.

52. But after launching the iPhone, Apple began stifling the development of cross-

platform technologies on the iPhone, just as Microsoft tried to stifle cross-platform technologies on Windows.

53. In January 2007, Apple debuted the first-generation iPhone. The original iPhone cost approximately \$299—approximately \$450 in 2024 dollars adjusted for inflation.

54. At launch, Apple largely created its own apps. There were only about a dozen apps overall, including Calendar, Camera, Clock, Contacts, iPod, Messages, Notes, Phone, Photos, Safari, Stocks, Voice Memos, and Weather.

55. Within a year of launching the iPhone, Apple invited third-party developers to create native apps for the iPhone. Apple released its first software development kit—essentially the digital tools for building native apps on Apple’s operating system (iOS)—to encourage and enable third-party developers to create native apps for the iPhone. Apple also offered developers ways to earn money by selling apps and later in-app purchases and subscriptions. By 2009, Apple was running marketing campaigns highlighting the value that third-party apps provide to iPhone users with the trademarked slogan: “There’s an app for that.”

56. Apple’s decision to invite third-party participation on its iPhone platform benefited Apple, too. The proliferation of third-party apps generated billions of dollars in profits for Apple and an iPhone user base of more than 250 million devices in the United States. Apple’s market shares—over 70 percent of the Performance Smartphone market and over 65 percent of the broader Smartphone market—likely understate its monopoly power today.

57. While Apple profits from third-party developers that increase the iPhone’s value to users, Apple executives understand that third-party products and services threaten to endanger its Smartphone monopoly, decreasing users’ dependence on Apple and the iPhone and increasing competitive pressure on Apple. Apple therefore willingly sacrifices the short-term benefits it

would gain from improved products and services developed by third parties when necessary to maintain its monopoly.

58. Apple controls how developers distribute and create apps for iPhone users. For example, developers can only distribute native iPhone apps through Apple's App Store, which is the only way for users to download native iOS apps. Limiting distribution to the Apple App Store enables Apple to exert monopoly power over developers by imposing contractual restrictions and rules that limit the behavior of non-Apple apps and services. Specifically, Apple sets the conditions for apps it allows on the Apple App Store through its App Store Review Guidelines. Under these guidelines, Apple has sole discretion to review and approve all apps and app updates. Apple selectively exercises that discretion to its own benefit, deviating from or changing its guidelines when it suits Apple's interests and allowing Apple executives to control app reviews and decide whether to approve individual apps or updates. Apple often enforces its App Store rules arbitrarily. And it frequently uses App Store rules and restrictions to penalize and restrict developers that take advantage of technologies that threaten to disrupt, disintermediate, compete with, or erode Apple's monopoly power.

59. Apple also controls app creation by deciding which APIs are available to developers when they make third-party apps. For example, developers cannot provide native apps on the iPhone unless they enter into Apple's non-negotiable Developer Program License Agreement (DPLA). That agreement requires developers to use public APIs only "in the manner prescribed by Apple." It also prohibits third-party apps from using APIs that Apple designates as "private." Apple selectively designates APIs as public or private to benefit Apple, limiting the functionality developers can offer to iPhone users even when the same functionality is available in Apple's own apps, or even select third-party apps. Similar to Apple's App Store restrictions,

Apple uses its DPLA to impose restrictions that penalize and restrict developers that take advantage of technologies that threaten to disrupt, disintermediate, compete with, or erode Apple's monopoly power.

60. Developers cannot avoid Apple's control of app distribution and app creation by making web apps—apps created using standard programming languages for web-based content and available over the internet—as an alternative to native apps. Many iPhone users do not look for or know how to find web apps, causing web apps to constitute only a small fraction of app usage. Apple recognizes that web apps are not a reasonable alternative to native apps for developers.

61. Nor can developers rely on alternative app stores even though this would benefit developers and users. For example, developers cannot offer iPhone users an app store that only offers apps curated for use by children, which would provide opportunities to improve privacy, security, and child safety. By contrast, Apple allows certain enterprise and public sector customers to offer versions of app stores with more curated apps to better protect privacy and security.

62. Apple's control over both app distribution and app creation gives Apple tremendous power. For example, Apple designates as “private” the APIs needed to send Short Message Service, or SMS, text messages, which is a protocol used by mobile carriers since the early 1990s to allow users to send basic text messages to other mobile phone numbers using their own mobile phone numbers. Developers have no technical means to access these private APIs, but even if they did, doing so would breach their developer agreement with Apple, and therefore put the developer at risk of losing the ability to distribute apps through the App Store. For example, Apple prohibits third-party iPhone apps from sending or receiving SMS text messages

even though this functionality is available through Apple Messages. Likewise, Apple can control the functionality of third-party apps and accessories through its control of app distribution because if an app includes functionality that Apple does not like, Apple can and does exercise its discretion to simply block the app from the App Store.

63. Apple's dominance is such that neither app developers nor iPhone users can benefit from lower cost or higher quality means of distributing apps or purchasing and providing digital products and services. Instead, Apple guarantees that it continues to benefit from the contributions of third-party developers and other platform participants while also protecting itself from the competitive threats and pressure those participants pose to Apple's Smartphone monopoly.

64. Apple uses its dominance to impose contracts and rules that restrict the behavior and design decisions of companies other than Apple.

65. Smartphones combine the functionality of a traditional mobile phone with advanced hardware and software components. This cluster of services and features results in a distinct product for consumers and developers. For example, Smartphones not only make phone calls, but also allow users to listen to music, send text messages, take pictures, play games, access software for work, manage their finances, and browse the internet.

66. Smartphones are platforms. Platforms bring together different groups that benefit from each other's participation on the platform. A food delivery app, for example, is a multi-sided platform that brings together restaurants, couriers, and consumers. A two-sided platform, for example, may bring together service providers on the one hand and consumers on the other. The technology and economics of a Smartphone platform are fundamentally different from the technology and economics of a simultaneous transaction platform, such as a credit card, because

Smartphone platforms compete over device features and pricing in ways that do not directly relate to app store transactions. Whereas credit card transactions reflect a single simultaneous action that requires both sides of the transaction for either side to exist, consumers value Smartphone platforms for a variety of reasons separate from their ability to facilitate a simultaneous transaction. Consumers care about non-transactional components of the phone, such as its camera and processing speed, and they care about non-transactional components of apps, such as their features and functionality.

67. The economics of a Smartphone platform are such that the platform's value to users—and in turn to the platform operator—increase when new apps and new features are added to the platform. In order to create these economic benefits for itself and its users, Apple has opened its Smartphone platform to third-party developers, whose countless inventions and innovations have created enormous value. Apple has willingly opened the platform to third-party developers to capture this value even though there is no extensive regulatory framework requiring it to do so or overseeing how it interacts with those third parties. In this way, Smartphone platforms are very different from other platforms, like landline telephone networks, whose value-adding features were built primarily by the platform operator, and which were only opened to third parties when the platform operator was required to do so by regulation. When a third-party developer for the iPhone creates a valuable new feature, consumers benefit and consumer demand goes up for Apple's products, increasing the economic value of the iPhone to Apple. This has played out hundreds of thousands of times for the iPhone, resulting in an enormously valuable Smartphone platform reflecting the combined contributions of millions of developers.

68. In contrast, limiting the features and functionality created by third-party

developers—and therefore available to iPhone users—makes the iPhone worse and deprives Apple of the economic value it would gain as the platform operator. It makes no economic sense for Apple to sacrifice the profits it would earn from new features and functionality unless it has some other compensating reason to do so, such as protecting its monopoly profits.

B. The Two Relevant Markets are the Markets for the Sale of New Smartphones and New Performance Smartphones in the United States

69. Mobile phones are portable devices that enable communications over radio frequencies instead of telephone landlines. These signals are transmitted by equipment covering distinct geographic areas, or “cells,” which is why mobile phones were called cell phones. The first commercial cell phones became available in the 1980s. Since then, improvements in both cell phone components and wireless technology have made it possible to transfer large volumes of data around the globe in a brief period. As a result, mobile phones began to offer a wider array of features and the adoption of mobile phones dramatically increased. Today, nearly all U.S. adults own a mobile phone.

70. Smartphones combine the functionality of a traditional mobile phone with advanced hardware and software components. Smartphones not only make phone calls, but allow users to listen to music, send text messages, take pictures, play games, access software for work, manage their finances, and browse the internet. Consumers choose between Smartphones based, in part, on their functionality. Today, Smartphone functionality is driven in large part, though not exclusively, by a combination of hardware and software components. Thus, in a competitive market, Smartphone manufacturers would compete and innovate to provide the best functionality.

71. Although consumers could replace some Smartphone functionality with separate devices such as by always carrying a camera and laptop, they generally prefer to access this

combination of functionality as part of a single device. Thus, phones with some but not all of these features are not reasonable substitutes for Smartphones. For example, a Canon or Nikon camera is not a substitute for an Apple or Samsung Smartphone notwithstanding that both these products are capable of taking digital pictures.

72. A Smartphone's hardware includes the frame and screen. Higher performing Smartphones are typically constructed from better materials like glass and metal instead of plastic, manufactured to higher standards that make them more durable (e.g., water and dust proof), and have higher quality displays.

73. A Smartphone's hardware also includes the semiconductor chipsets that run the Smartphone: central processing of software instructions, graphics, video, display, memory, data storage, and connection to wireless networks. Chipsets that offer superior performance—faster processing and network connections, better graphics, more storage—are costly. As a result, Smartphone manufacturers typically include them only in more expensive Performance Smartphones.

74. Smartphone hardware includes other important components like cameras, and position and motion sensors. Performance Smartphones typically have higher quality cameras, better battery life, wireless charging, and advanced biometrics such as face scanning.

75. Smartphones also contain several types of antennas that allow the phone to communicate with other Smartphones, accessories, or other devices using standard communication protocols such as Wi-Fi, Bluetooth, and Near-Field Communications (NFC).

76. Wi-Fi is a wireless networking technology that uses radio waves to provide wireless high-speed Internet access through mobile devices, computers, printers, and other equipment. "Wi-Fi," in particular, refers to IEEE 802.11 standards that define the protocols that

enable communications with current Wi-Fi-enabled wireless devices such as wireless routers and access points.

77. Bluetooth is a wireless standard that allows Smartphones to use shortwave radios to communicate with accessories like headphones and smartwatches. An industry-wide Bluetooth standard specifies technological requirements to ensure that all Bluetooth devices can recognize and interact with each other. A typical Bluetooth signal has a range of about thirty feet.

78. Near Field Communication (NFC) allows Smartphones to interact with NFC-enabled devices like a credit card terminal at a coffee shop. NFC relies on short-range wireless technologies, including radio signals, to communicate and share information. To operate, two NFC-enabled devices must typically be within four centimeters or less of one another.

79. Three device manufacturers, Apple, Samsung, and Google, account for approximately 94 percent of all Smartphones by revenue in the United States. Apple and Samsung alone account for approximately 90 percent of all Smartphone revenues in the United States.

80. Cloud-based technologies are run using hardware and software in remote computing centers (“the cloud”) rather than by hardware and software on a Smartphone. The user experiences the technology on the phone but the complex computing that generates the rich experience and that executes the user’s commands happens in the cloud. Thus, cloud apps can deliver rich experiences on Smartphones with less capable hardware than iPhones currently contain.

81. In addition to hardware, Smartphones include various software components that make a Smartphone more attractive to users.

82. The most important software component is a Smartphone's operating system, the foundational software that manages both the hardware and other software programs on the device. All iPhones are preloaded with Apple's proprietary, exclusive iPhone operating system called iOS. The only other significant mobile operating system in the United States is Google's Android, which works with Smartphones manufactured by Samsung, whose U.S. headquarters is located in this district, Google, Motorola, and smaller players. Software applications, known as "apps," are programs that perform specific tasks at the Smartphone user's request, such as sending messages, playing music, or web browsing. Apps depend on a Smartphone's operating system to function. For example, to make a video call, apps must communicate with a Smartphone's operating system to access various hardware components on the phone, such as the camera, microphone, and speaker. Apps communicate with a Smartphone's operating system through APIs.

83. Apps that work with a particular Smartphone operating system are called native apps. Thus, Apple's native iOS apps work with iPhone and native Android apps work with Android Smartphones.

84. Most app developers do not view Android as a substitute for iOS or iOS as a substitute for Android. The overwhelming majority of users choose a single phone and do not "multi-home" by carrying an Android phone and the iPhone at the same time. Thus, a developer cannot reach iPhone users on Android or Android users on iPhones. Due to the lack of user multi-homing, most developers create native apps for both iOS and Android to reach the greatest number of Smartphone users. For example, a food delivery or ride-sharing app cannot develop an app just for Android phones or just for the iPhone. Developing for both platforms is often necessary for developers to reach the scale they need to be viable.

85. It is also important to develop apps for the iPhone and other Smartphone platforms because most apps are increasingly “social” in nature and require users on one platform to reach users on the other. For example, the developer of a dating app must enable its users on iPhones to meet users on Android and vice-versa. A money-sharing app must enable users on Android devices to send money to users on iPhones and vice versa.

86. App developers typically provide a similar user experience for native apps on iPhones and Android Smartphones to minimize the resources and risks of maintaining different features across different Smartphones. Even so, developers must program native apps to work with a specific operating system and so they do not always interoperate or synchronize across different operating systems.

87. Middleware is software that provides similar APIs and functionality across a diverse set of operating systems and devices. This allows developers to create cross-platform applications without having to write separate code for individual operating systems or devices because developers can rely on the APIs exposed by the middleware rather than APIs that only work on specific operating systems or devices. Apple has long understood how middleware can help promote competition and its myriad benefits, including increased innovation and output, by increasing scale and interoperability. In the context of Smartphones, examples of middleware include internet browsers, internet or cloud-based apps, super apps, and smartwatches, among other products and services. While not meeting the technical definition of middleware, certain other products and services may nonetheless have the same economic impact as middleware, such as eliminating the added expense of porting a product or experience across hardware or operating systems. For the purposes of this complaint middleware refers to both technical middleware and to products and services that, while not technically middleware, have the same

economic effect.

1. Relevant Product Markets

88. All Smartphones compete against each other in a broad relevant market. But industry participants, including Apple, assess competition among Smartphones in narrower markets that are best understood as submarkets of the larger all-Smartphone market. Because Apple chooses not to compete to sell new Smartphones in the entry-level tier, the most relevant market to assess its conduct is a narrower submarket that excludes this tier. Regardless of how the market is drawn, however, Apple's conduct is unlawful.

a. Performance Smartphones are a relevant product market

89. Performance Smartphones are a narrower relevant product market or "submarket" within the broader Smartphone market. This narrower market includes those Smartphones that compete with most iPhones and excludes the lowest-end Smartphones, which industry participants sometimes refer to as "entry-level" Smartphones.

90. Industry participants recognize Performance Smartphones as distinct and frequently group Smartphones into tiers that include entry-level Smartphones and higher tiers such as "premium" or "flagship."

91. Apple has also long recognized a distinction between these higher-end Smartphones and lower-end, entry-level Smartphones. Apple's own conduct indicates it does not view entry-level Smartphones as competing with the iPhone and other Performance Smartphones.

92. Performance Smartphones have distinct characteristics and uses as compared to other Smartphones. For example, entry-level Smartphones are generally made with lower-quality materials and are less durable (e.g., plastic instead of metal and glass). They have lower-performance components such as slower processors and lower-capacity storage, which prevent

users from running more intensive applications or storing large volumes of pictures and data on the device. Entry-level Smartphones often lack features such as an NFC antenna that allows consumers to use their phone to make payments or access passes for public transit.

93. Consumers typically purchase Performance Smartphones under different terms than entry-level Smartphones. Consumers generally use entry-level Smartphones along with pre-paid service plans.

94. Because of these differences, among others, between entry-level Smartphones and Performance Smartphones, entry-level Smartphones are not reasonable substitutes for Performance Smartphones.

95. Moreover, competition from non-Performance Smartphones is not sufficient today to prevent Apple from exercising monopoly power in the Performance Smartphone market.

b. Smartphones are a broader relevant product market

96. Smartphones are a relevant product market. Smartphones are distinct from phones that offer less capable hardware and software options than Smartphones. These other phones, sometimes called “feature phones,” may offer basic web browsing in addition to calling and messaging options, but do not offer the breadth of access to the internet or third-party apps as Smartphones. Similarly, these phones often have lower-quality hardware, such as poorer displays, less capable cameras, and rely on physical keyboards instead of Smartphone touch screens. Thus, these phones are not reasonable substitutes for Smartphones.

97. Smartphones are also distinct from other portable devices, such as tablets, smartwatches, and laptop computers. These devices lack the combination of function, size, and portability that consumers rely on in a Smartphone, even if they offer some similar capabilities. Thus, none of these other products are reasonable substitutes for Smartphones.

98. Apple, other participants in the market, and the public recognize that Smartphones are distinct from feature phones and other portable devices.

99. Competition from feature phones, or other alternatives, is not sufficient to prevent Apple from exercising monopoly power in the Smartphone market.

2. Relevant Geographic Market

100. The United States is a relevant geographic market for the sale of Performance Smartphones and Smartphones. A Smartphone purchased abroad for use in the United States might be incompatible with the consumer's domestic carrier, may not have the necessary radio technology to take advantage of the carrier's highest speed connections, the carrier might not be able to offer support during setup or subsequently, or the phone's warranty may be invalid.

101. Finally, potential new entrants to the U.S. Smartphone market must also comply with telecommunications regulations and satisfy other legal requirements. No extensive regulatory framework governs how Apple operates its platform with respect to developers, but there are a number of regulatory requirements that must be met in order to enter the Smartphone market. For example, some Smartphone makers are effectively barred from offering their Smartphones to U.S. consumers.

102. Consumers in the United States could not avoid or defeat an increase in the price of Performance Smartphones or Smartphones by purchasing and importing Smartphones from abroad. This allows Apple to set prices for the same Smartphone in the United States separately from those in other countries. For example, Apple lowered the price of the iPhone 11 in China relative to the United States because Apple faced greater competition in China. This additional competition arises in part because a popular super app put competitive pressure on Apple and made it easier for users to switch from an iPhone to a rival Smartphone. As a result, Apple is unable to command the same prices for the iPhone in China than they do in the United States due

to less competition.

C. Apple Has Monopoly Power in the Relevant Markets

103. Apple has monopoly power in the Smartphone and Performance Smartphone markets because it has the power to control prices or exclude competition in each of them. Apple also enjoys substantial and durable market shares in these markets. Moreover, Apple's market shares likely underestimate Apple's power because they are protected by significant barriers to entry, network effects, and switching costs. Apple recognizes and exploits these barriers to entry, network effects, and switching costs to protect itself from competition from rival platforms and innovations, products, and services that may diminish consumer reliance on the iPhone. Apple's power will likely increase over time.

104. In the U.S. market for Performance Smartphones, where Apple views itself as competing, Apple estimates its market share exceeds 70 percent. These estimates likely understate Apple's market share today. For example, Apple's share among key demographics, including younger audiences and higher-income households, is even larger. Even in the broadest market consisting of all Smartphones—including many Smartphones that Apple and industry participants do not view as competing with Apple's iPhones and other higher-end phones—Apple's share is more than 65 percent by revenue. Similarly, even if consumers choose one phone over another, the vast majority of developers consider iPhones and Android devices as complements because developers must build apps that run on both platforms due to the lack of user multi-homing. In effect, the lack of multi-homing among users necessitates multi-homing among developers. This market reality increases the power Apple is able to exercise over developers that seek to reach users on Smartphones—especially Performance Smartphones that run sophisticated apps.

105. Apple's high market shares are durable. Over the last decade, Apple increased its

share of Smartphones sold in the United States most years. Through the same period, Apple collected more than half the revenue for all Smartphones sold in the United States.

106. Apple's monopoly power in the relevant markets is protected by substantial barriers to entry and expansion. For example, since fewer than ten percent of Smartphone purchasers in the United States are buying their first Smartphone, there are fewer new customers available for Apple's rivals. Instead, rivals must encourage existing iPhone users to switch from using an iPhone to using another Smartphone when they replace or upgrade their phone. As a result, switching costs—many created or exacerbated by Apple—impose substantial barriers to entry and expansion for rival Smartphones. This barrier is increasingly impenetrable. Nearly 90 percent of iPhone owners in the United States replace their iPhone with another iPhone. At least one U.S. carrier estimates that as high as 98 percent of iPhone users on its network replace or upgrade their iPhone in a given quarter by buying another iPhone. The increased switching costs that consumers experience because of Apple's conduct underpins these exceedingly high retention rates.

107. Apple's monopoly power in the relevant markets is protected by other barriers to entry, expansion, or repositioning as well. For example, introducing a new Smartphone requires considerable investments in acquiring expensive and scarce components such as mobile chips and specialized glass for screens. Other significant barriers to entry include product design, software development, regulatory approval, manufacturing, marketing, and customer service. As explained above, rival Smartphones must also overcome the substantial network effects generated by interactions between users, developers, and others who interact with the iPhone.

108. Apple's iPhone platform is protected by several additional barriers to entry and expansion, including strong network and scale effects and high switching costs and frictions. For

example, if an iPhone user wants to buy an Android Smartphone, they are likely to face significant financial, technological, and behavioral obstacles to switching. The user may need to re-learn how to operate their Smartphone using a new interface, transfer large amounts of data (e.g., contacts), purchase new apps, or transfer or buy new subscriptions and accessories. These switching costs and frictions are even higher when software applications, APIs, and other functionality do not help the different devices and operating systems communicate and interoperate. These switching costs and frictions increase the “stickiness” of the iPhone, making users more beholden to the Smartphone manufacturer and platform operator.

109. Many prominent, well-financed companies have tried and failed to successfully enter the relevant markets because of these entry barriers. Past failures include Amazon (which released its Fire mobile phone in 2014 but could not profitably sustain its business and exited the following year); Microsoft (which discontinued its mobile business in 2017); HTC (which exited the market by selling its Smartphone business to Google in September 2017); and LG (which exited the Smartphone market in 2021). Today, only Samsung and Google remain as meaningful competitors in the U.S. Performance Smartphone market. Barriers are so high that Google is a distant third to Apple and Samsung despite the fact that Google controls development of the Android operating system.

110. Apple’s monopoly power is separately demonstrated by direct indicia. For example, Apple can and does profitably forego innovation without fear of losing customers to competitors.

111. Apple’s profits and profit margins, for nearly every aspect of the iPhone, are further evidence of Apple’s monopoly power. For example, Apple’s per-unit Smartphone profit margins are far more than its next most profitable rival. Apple charges carriers considerably

more than its rivals to buy and resell its Smartphones to the public and employs contract clauses that may impede the ability of carriers to promote rival Smartphones, a harmful exercise of monopoly power that is hidden to most consumers. Apple extracts fees from developers—as much as 30 percent when users purchase apps or make in-app payments. Apple also extracts a 0.15 percent commission from banks on credit card transactions through its digital wallet, while none of its Smartphone competitors with digital wallets charge any fee. Apple predicts that it will collect nearly \$1 billion in worldwide revenue on Apple Pay fees by 2025. A recent report by the U.S. Consumer Financial Protection Bureau suggests these revenues will only increase, as “analysts expect the value of digital wallet tap-to-pay transactions will grow by over 150 percent by 2028.”

112. Apple increasingly charges developers additional fees to promote their apps in the App Store as well. This is one of the fastest-growing parts of Apple’s services business.

113. These indicia of Apple’s monopoly power are direct evidence of its monopoly power in the relevant markets.

D. Apple Unlawfully Maintains Its Monopoly Power

1. Apple harms competition by imposing contractual restrictions, fees, and taxes on app creation and distribution

114. Soon after the iPhone’s introduction and notwithstanding its success, the company began to fear that disintermediation of its platform and the commoditization of the iPhone would threaten Apple’s substantial profits from iPhone sales and related revenue streams.

115. Accordingly, Apple exercised its control of app creation and app distribution in key cases to cement the iPhone and App Store as the primary gateway to apps, products, and services. Apple often claims these rules and restrictions are necessary to protect user privacy or security, but Apple’s conduct tells a different story. In reality, Apple imposes certain restrictions

to benefit its bottom line by thwarting direct and disruptive competition for its iPhone platform fees and/or for the importance of the iPhone platform itself.

116. Three aspects of Apple's efforts to protect and exploit its Smartphone monopoly are worth noting. First, Apple exercises its control over app distribution and app creation to dictate how developers innovate for the iPhone, enforcing rules and contractual restrictions that stop or delay developers from innovating in ways that threaten Apple's power. In so doing, Apple influences the direction of innovation both on and off the iPhone.

117. Second, Apple drives iPhone users away from products and services that compete with or threaten Apple. In doing so, Apple increases the cost and friction of switching from the iPhone to another Smartphone and generates extraordinary profits through subscription services (like Apple's proprietary music, gaming, cloud storage, and news services), advertisements within the App Store, and accessories like headphones and smartwatches.

118. Third, Apple uses these restrictions to extract monopoly rents from third parties in a variety of ways, including app fees and revenue-share requirements. For most of the last 15 years, Apple collected a tax in the form of a 30 percent commission on the price of any app downloaded from the App Store, a 30 percent tax on in-app purchases, and fees to access the tools needed to develop iPhone native apps in the first place. While Apple has reduced the tax it collects from a subset of developers, Apple still extracts 30 percent from many app makers. Apple also generates substantial and increasing revenue by charging developers to help users find their apps in the App Store—something that, for years, Apple told developers was part of the reason they paid a 30 percent tax in the first place. For example, Apple will sell keyword searches for an app to someone other than the owner of the app. Apple is able to command these rents from companies of all sizes, including some of the largest and most sophisticated

companies in the world.

119. As Apple exercised its control of app distribution and app creation, Apple slowed its own iPhone innovation and extracted more revenue and profit from its existing customers through subscriptions, advertising, and cloud services. These services increase the cost of switching from the iPhone to another Smartphone because many of these services—including its proprietary gaming, cloud storage, and news service—are exclusive to the Apple ecosystem, causing significant frictions for iPhone users who try to use alternative services on another Smartphone. Moreover, Apple’s conduct demonstrates that Apple recognized the importance of digital products and services for the success of the iPhone while at the same time it restricted the development and growth of non-iPhone products and services—especially those that might make it easier for users to switch from the iPhone to another Smartphone.

120. Each step in Apple’s course of conduct built and reinforced the moat around its Smartphone monopoly. The cumulative effect of this course of conduct has been to maintain and entrench Apple’s Smartphone monopoly at the expense of the users, developers, and other third parties who helped make the iPhone what it is today. Despite major technological changes over the years, Apple’s power to control app creation and distribution and extract fees from developers has remained largely the same, unconstrained by competitive pressures or market forces. That this conduct is impervious to competition reflects the success of Apple’s efforts to create and maintain its Smartphone monopoly, the strength of that monopoly, and the durability of Apple’s power.

121. Apple’s monopoly maintenance has taken many forms and continues to evolve today; however, Apple’s anticompetitive and exclusionary course of conduct is exemplified by its contractual rules and restrictions targeting several products and services: super apps, cloud

streaming apps, messaging apps, smartwatches, and digital wallets. By stifling these technologies, and many others, Apple reinforces the moat around its Smartphone monopoly not by making its products more attractive to users, but by discouraging innovation that threatens Apple's Smartphone monopoly or the disintermediation of the iPhone. Apple continues to expand and shift the scope and categories of anticompetitive conduct such that the cumulative anticompetitive effect of Apple's conduct is even more powerful than that of each exclusionary act standing alone.

a. Super Apps: Apple prevented apps from threatening its Smartphone monopoly by undermining mini programs that reduce user dependence on the iPhone

122. For years, Apple denied its users access to super apps because it viewed them as threatening to Apple's monopoly power. Apple feared super apps because it recognized that as they become popular demand for the iPhone would be reduced. So, Apple used its control over app distribution and app creation to effectively prohibit developers from offering super apps instead of competing on the merits.

123. A super app is an app that can serve as a platform for smaller "mini" programs developed using programming languages such as HTML5 and JavaScript. By using programming languages standard in most web pages, mini programs are cross platform, meaning they work the same on any web browser and on any device. Developers can therefore write a single mini program that works whether users have an iPhone or another Smartphone.

124. Super apps can provide significant benefits to users. For example, a super app that incorporates a multitude of mini programs might allow users to easily discover and access a wide variety of content and services without setting up and logging into multiple apps, not unlike how Netflix and Hulu allow users to find and watch thousands of movies and television shows in a single app. As one Apple executive put it, "who doesn't want faster, easier to discover apps

that do everything a full app does?” Restricting super apps makes users worse off and sacrifices the short-term profitability of iPhones for Apple.

125. Super apps also reduce user dependence on the iPhone, including the iOS operating system and Apple’s App Store. This is because a super app is a kind of middleware that can host apps, services, and experiences without requiring developers to use the iPhone’s APIs or code.

126. As users interact with a super app, they rely less on the Smartphone’s proprietary software and more on the app itself. Eventually, users become more willing to choose a different Smartphone because they can access the same interface, apps, and content they desire on any Smartphone where the super app is also present. Moreover, developers can write mini programs that run on the super app without having to write separate apps for iPhones and other Smartphones. This lowers barriers to entry for Smartphone rivals, decreases Apple’s control over third-party developers, and reduces switching costs.

127. Apple recognizes that super apps with mini programs would threaten its monopoly. Apple’s fear of super apps is based on first-hand experience with enormously popular super apps in Asia. Apple does not want U.S. companies and U.S. users to benefit from similar innovations.

128. Apple did not respond to the risk that super apps might disrupt its monopoly by innovating. Instead, Apple exerted its control over app distribution to stifle others’ innovation. Apple created, strategically broadened, and aggressively enforced its App Store Guidelines to effectively block apps from hosting mini programs. Apple’s conduct disincentivized investments in mini program development and caused U.S. companies to abandon or limit support for the technology in the United States.

129. In particular, part of what makes super apps valuable to consumers is that finding and using mini programs is easier than using an app store and navigating many separate apps, passwords, and set-up processes. Instead of making mini program discovery easy for users, however, Apple made it nearly impossible.

130. Since at least 2017, Apple has arbitrarily imposed exclusionary requirements that unnecessarily and unjustifiably restrict mini programs and super apps. For example, Apple required apps in the United States to display mini programs using a flat, text-only list of mini programs. Apple also banned displaying mini programs with icons or tiles, such as descriptive pictures of the content or service offered by the mini program. Apple also banned apps from categorizing mini programs, such as by displaying recently played games or more games by the same developer. These restrictions throttle the popularity of mini programs and ultimately make the iPhone worse because it discourages developers from creating apps and other content that would be attractive to iPhone users.

131. Apple also selectively enforced its contractual rules with developers to prevent developers from monetizing mini programs, hurting both users and developers. For example, Apple blocked mini programs from accessing the APIs needed to implement Apple's in-app payment (IAP) system—even if developers were willing to pay Apple's monopoly tax. Similarly, Apple blocked developers' ability to use in-app payment methods other than directly using IAP. For instance, super apps could create a virtual currency for consumers to use in mini programs, but Apple blocked this too. Apple, however, allows other, less-threatening apps to do so.

b. Cloud Streaming Apps: Apple prevented developers from offering cloud gaming apps that reduce dependence on the iPhone's expensive hardware

132. For years, Apple blocked cloud gaming apps that would have given users access

to desirable apps and content without needing to pay for expensive Apple hardware because this would threaten its monopoly power. Apple's conduct made its own product worse because consumers were and are deprived of apps and content. This conduct also cost Apple substantial revenues from third-party developers. At the same time, Apple also made other Smartphones worse by stifling the growth of these cross-platform apps on other Smartphones. Importantly, Apple prevented the emergence of technologies that could lower the price that consumers pay for iPhones.

133. Cloud streaming apps let users run a computationally intensive program without having to process or store the program on the Smartphone itself. Instead, a user's Smartphone leverages the computing power of a remote server, which runs the program and streams the result back to the phone. Cloud streaming allows developers to bring innovative technologies and services to Smartphone consumers—including gaming and interactive artificial intelligence services—even if their Smartphone includes hardware that is less powerful than an iPhone.

134. Cloud streaming has significant benefits for users. Powerful hardware is unnecessary if games are played via cloud streaming apps. For a cloud game, the user experiences and plays the game on the Smartphone, but the game is run by hardware and software in remote computing centers ("the cloud"). Thus, cloud gaming apps deliver rich gaming experiences on Smartphones without the need for users to purchase powerful, expensive hardware. As a result, users with access to cloud streamed games may be more willing to switch from an iPhone to a Smartphone with less expensive hardware because both Smartphones can run desirable games equally well.

135. Cloud streaming also has significant advantages for developers. For example, instead of re-writing the same game for multiple operating systems, cloud platforms can act as

middleware that allow developers to create a single app that works across iOS, Android, and other operating systems. Cloud streaming provides more and simpler options for offering subscriptions, collecting payments, and distributing software updates as well. All of this helps game developers reach economies of scale and profitability they might not achieve without offering cloud gaming apps and reduces their dependence on iOS and Apple's App Store.

136. Apple wielded its power over app distribution to effectively prevent third-party developers from offering cloud gaming subscription services as a native app on the iPhone. Even today, none are currently available on the iPhone.

137. For years, Apple imposed the onerous requirement that any cloud streaming game—or any update to a cloud streaming game—be submitted as a stand-alone app for approval by Apple. Having to submit individual cloud streaming games for review by Apple increased the cost of releasing games on the iPhone and limited the number of games a developer could make available to iPhone users. For example, the highest quality games, referred to as AAA games, typically require daily or even hourly updates across different platforms. If these updates need to be individually approved by Apple, developers must either delay their software updates across all platforms or only update their games on non-iOS platforms, potentially making the iOS version of the game incompatible with other versions on other platforms until Apple approves the update. Neither option is tenable for players or developers.

138. Until recently, Apple would have required users to download cloud streaming software separately for each individual game, install identical app updates for each game individually, and make repeated trips to Apple's App Store to find and download games. Apple's conduct made cloud streaming apps so unattractive to users that no developer designed one for the iPhone.

139. Apple undermines cloud gaming apps in other ways too, such as by requiring cloud games to use Apple’s proprietary payment system and necessitating game overhauls and payment redesigns specifically for the iPhone. Apple’s rules and restrictions effectively force developers to create a separate iOS-specific version of their app instead of creating a single cloud-based version that is compatible with several operating systems, including iOS. As a result, developers expend considerable time and resources re-engineering apps to bring cross-platform apps like multiplayer games to the iPhone.

140. Cloud streaming apps broadly speaking—not just gaming—could force Apple to compete more vigorously against rivals.

2. Apple uses APIs and other critical access points in the Smartphone ecosystem to control the behavior and innovation of third parties in order to insulate itself from competition.

a. Messaging: Apple protects its Smartphone monopoly by degrading and undermining cross-platform messaging apps and rival Smartphones

141. Apple continues to impede innovation in Smartphone messaging, even though doing so sacrifices the profits Apple would earn from increasing the value of the iPhone to users, because it helps build and maintain its monopoly power.

142. Messaging apps allow Smartphone users to communicate with friends, family, and other contacts and are often the primary way users interact with their Smartphones.

143. Smartphone messaging apps operate using “protocols,” which are the systems that enable communication and determine the features available when users interact with each other via messaging apps.

144. One important protocol used by messaging apps is SMS. SMS offers a broad user network, but limited functionality. For example, all mobile phones can receive SMS messages, but SMS does not support modern messaging features, such as large files, edited messages, or

reactions like a “thumbs up” or a heart. Throughout this complaint, “SMS” refers to both SMS and MMS (“multimedia messaging service”). MMS is a companion protocol to SMS that allows for group messages and messages with basic multimedia content, such as small file sharing.

145. Many messaging apps—such as WhatsApp, Facebook Messenger, and Signal—use proprietary, internet-based protocols, which are sometimes referred to as OTT (“over the top”) protocols. OTT messaging typically involves more secure and advanced features, such as encryption, typing indicators, read receipts, the ability to share rich media, and disappearing or ephemeral messages. While all mobile phones can send and receive SMS messages, OTT only works between users who sign up for and communicate through the same messaging app. As a result, a user cannot send an OTT message to a friend unless the friend also uses the same messaging app.

146. Apple makes third-party messaging apps on the iPhone worse both generally and relative to Apple Messages, Apple’s own messaging app. By doing so, Apple is knowingly and deliberately degrading quality, privacy, and security for its users. For example, Apple designates the APIs needed to implement SMS as “private,” meaning third-party developers have no technical means of accessing them and are prohibited from doing so under Apple’s contractual agreements with developers. As a result, third-party messaging apps cannot combine the “text to anyone” functionality of SMS with the advanced features of OTT messaging. Instead, if a user wants to send somebody a message in a third-party messaging app, they must first confirm whether the person they want to talk to has the same messaging app and, if not, convince that person to download and use a new messaging app. By contrast, if an Apple Messages user wants to send somebody a message, they just type their phone number into the “To:” field and send the message because Apple Messages incorporates SMS and OTT messaging.

147. Apple prohibits third-party developers from incorporating other key features into their messaging apps as well. For example, third-party messaging apps cannot continue operating in the background when the app is closed, which impairs functionality like message delivery confirmation. And when users receive video calls, third-party messaging apps cannot access the iPhone camera to allow users to preview their appearance on video before answering a call. Apple Messages incorporates these features.

148. If third-party messaging apps could incorporate these features, they would be more valuable and attractive to users, and the iPhone would be more valuable to Apple in the short term. For example, by incorporating SMS, users would avoid the hassle of convincing someone to download a separate app before sending them a message. Third-party messaging apps could also offer the ability to schedule SMS messages to be sent in the future, suggest replies, and support robust multi-device use on Smartphones, tablets, and computers—as they have already done on Android.

149. Moreover, messaging apps benefit from significant network effects—as more people use the app, there are more people to communicate with through the app, which makes the app more valuable and in turn attracts even more users. Incorporating SMS would help third-party messaging apps grow their network and attract more users. Instead, Apple limits the reach of third-party messaging apps and reinforces network effects that benefit Apple.

150. In addition to degrading the quality of third-party messaging apps, Apple affirmatively undermines the quality of rival Smartphones. For example, if an iPhone user messages a non-iPhone user in Apple Messages—the default messaging app on an iPhone—then the text appears to the iPhone user as a green bubble and incorporates limited functionality: the conversation is not encrypted, videos are pixelated and grainy, and users cannot edit messages or

see typing indicators. This signals to users that rival Smartphones are lower quality because the experience of messaging friends and family who do not own iPhones is worse—even though Apple, not the rival Smartphone, is the cause of that degraded user experience. Many non-iPhone users also experience social stigma, exclusion, and blame for “breaking” chats where other participants own iPhones. This effect is particularly powerful for certain demographics, like teenagers—where the iPhone’s share is 85 percent, according to one survey. This social pressure reinforces switching costs and drives users to continue buying iPhones—solidifying Apple’s Smartphone dominance not because Apple has made its Smartphone better, but because it has made communicating with other Smartphones worse.

151. Apple has long recognized that its conduct harms users and makes it more difficult to switch Smartphones. Recently, Apple blocked a third-party developer from fixing the broken cross- platform messaging experience in Apple Messages and providing end-to-end encryption for messages between Apple Messages and Android users. By rejecting solutions that would allow for cross-platform encryption, Apple continues to make iPhone users’ less secure than they could otherwise be.

b. Smartwatches: Apple protects its Smartphone monopoly by impeding the development of cross-platform smartwatches

152. Apple uses smartwatches, a costly accessory, to prevent iPhone customers from choosing other phones. Having copied the idea of a smartwatch from third-party developers, Apple now prevents those developers from innovating and limits the Apple Watch to the iPhone to keep tight its hold on its monopoly.

153. Smartwatches are wrist-worn devices with an interactive display and accompanying apps that let users perform a variety of functions, including monitoring health data, responding to messages and notifications, performing mobile payments, and, of course,

telling time. Smartwatches must generally be paired with a Smartphone to operate and unlock their full functionality, such as receiving and responding to emails and text messages or answering phone calls. Because of the significant cost of buying a smartwatch, users are less willing to choose a Smartphone if it is not compatible with their smartwatch.

154. Apple's smartwatch—Apple Watch—is only compatible with the iPhone.

155. So, if Apple can steer a user towards buying an Apple Watch, it becomes more costly for that user to purchase a different kind of Smartphone because doing so requires the user to abandon their costly Apple Watch and purchase a new, Android-compatible smartwatch.

156. By contrast, cross-platform smartwatches can reduce iPhone users' dependence on Apple's proprietary hardware and software. If a user purchases a third-party smartwatch that is compatible with the iPhone and other Smartphones, they can switch from the iPhone to another Smartphone (or vice versa) by simply downloading the companion app on their new phone and connecting to their smartwatch via Bluetooth. Moreover, as users interact with a smartwatch, e.g., by accessing apps from their smartwatch instead of their Smartphone, users rely less on a Smartphone's proprietary software and more on the smartwatch itself. This also makes it easier for users to switch from an iPhone to a different Smartphone.

157. Apple recognizes that driving users to purchase an Apple Watch, rather than a third-party cross-platform smartwatch, helps drive iPhone sales and reinforce the moat around its Smartphone monopoly. Surveys show that many users say the other devices linked to their iPhone are the reason they do not switch to Android.

158. Apple uses its control of the iPhone, including its technical and contractual control of critical APIs, to degrade the functionality of third-party cross-platform smartwatches in at least three significant ways. First, Apple deprives iPhone users with third-party

smartwatches of the ability to respond to notifications. Second, Apple inhibits third-party smartwatches from maintaining a reliable connection with the iPhone. And third, Apple undermines the performance of third-party smartwatches that connect directly with a cellular network. In doing so, Apple constrains user choice and crushes innovation that might help fill in the moat around Apple's Smartphone monopoly.

159. The ability to respond to notifications, e.g., new messages or app alerts, directly from a smartwatch is one of the top considerations for smartwatch purchasers—and one of the most used product features when it is available. In 2013, when Apple started offering users the ability to connect their iPhones with third-party smartwatches, Apple provided third-party smartwatch developers with access to various APIs related to the Apple Notification Center Service, Calendar, Contacts, and Geolocation. The following year, Apple introduced the Apple Watch and began limiting third-party access to new and improved APIs for smartwatch functionality. For example, Apple prevents third-party smartwatches from accessing APIs related to more advanced Actionable Notifications, so iPhone users cannot respond to notifications using a third-party smartwatch. Instead, Apple provides third-party smartwatches access to more limited APIs that do not allow users to respond to a message, accept a calendar invite, or take other actions available on Apple Watch.

160. A reliable Bluetooth connection is essential for a smartwatch to connect wirelessly with a Smartphone, and thereby function as a companion to the user's Smartphone and unlock its full functionality. But Apple prohibits third-party smartwatch developers from maintaining a connection even if a user accidentally turns off Bluetooth in the iPhone's control center. However, Apple gives its own Apple Watch that functionality because Apple recognizes that users frequently disable Bluetooth on their iPhone without realizing that doing so

disconnects their watch. As a result, iPhone users have a worse experience when they try to use a third-party smartwatch with their iPhone. Apple also requires users to turn on “Background App Refresh” and disable the battery-saving “Low Power Mode” in their iPhone settings for third- party smartwatches to remain consistently connected to their companion app, which is necessary to allow a user’s iPhone and their smartwatch to update and share data about the weather or exercise tracking, even though Apple does not impose similar requirements for Apple Watch.

161. Cellular-enabled smartwatches incorporate the ability to connect directly to a cellular network, allowing users to make calls, send messages, and download data even if their smartwatch is not paired to a Smartphone. Cellular-enabled smartwatches are popular with consumers, making up approximately 20 percent of Apple Watch sales. Apple Watch users can use the same phone number for their Smartphone and smartwatch when connected to the cellular network. As a result, messages are delivered to both the user’s Smartphone and smartwatch, providing an integrated messaging experience. Although it is technologically feasible for Apple to allow an iPhone user with a third-party smartwatch to do the same, Apple instead requires these users to disable Apple’s iMessage service on the iPhone in order to use the same phone number for both devices. This is a non-starter for most iPhone users. In practice, iPhone users with a third-party smartwatch must maintain separate phone numbers for the two devices, worsening their user experience.

c. Digital Wallets: Apple restricts cross-platform digital wallets on the iPhone, reinforcing barriers to consumers switching to rival Smartphones.

162. Apple recognizes that paying for products and services with a digital wallet will eventually become a daily occurrence. But Apple has used its control over app creation, including its technical and contractual control over API access, to effectively block third-party

developers from creating digital wallets on the iPhone with tap-to-pay functionality, which is an important feature of a digital wallet for Smartphones. As a result, Apple maintains complete control over how users make tap-to-pay payments with their iPhone. Apple also deprives users of the benefits and innovations third-party wallets would provide so that it can protect its iPhone monopoly.

163. Digital wallets are apps that allow a user to store, and use passes and credentials, including credit cards, personal identification, movie tickets, and car keys, in a single app.

164. For example, digital wallets allow users to make in-person payments by tapping their device on a payment terminal rather than tapping or swiping a physical credit card. Digital wallets can also be used for transactions in mobile apps and mobile websites.

165. Absent Apple's conduct, cross-platform digital wallets could also be used to manage and pay for subscriptions and in-app purchases.

166. Apple Wallet is Apple's proprietary digital wallet on the iPhone. Apple Wallet incorporates Apple's proprietary payment system Apple Pay, which processes digital payments on the web, in apps, and at merchant points of sale.

167. Today, Apple Wallet offers users a way to make these payments using their iPhone. But Apple envisions that Apple Wallet will ultimately supplant multiple functions of physical wallets to become a single app for shopping, digital keys, transit, identification, travel, entertainment, and more. As users rely on Apple Wallet for payments and beyond, it entrenches Apple's monopoly because Apple Wallet is only available on the iPhone. Thus, switching to a different Smartphone requires leaving behind the familiarity of an everyday app, setting up a new digital wallet, and potentially losing access to certain credentials and personal data stored in Apple Wallet.

168. Cross-platform digital wallets would offer an easier, more seamless, and potentially more secure way for users to switch from the iPhone to another Smartphone. For example, if third-party developers could create cross-platform wallets, users transitioning away from the iPhone could continue to use the same wallet, with the same cards, IDs, payment histories, peer-to-peer payment contacts, and other information, making it easier to switch Smartphones. And because many users already use apps created by their preferred financial institutions, if these financial institutions offered digital wallets, then users would have access to new apps and technologies without needing to share their private financial data with additional third parties, including Apple. In the short term, these improved features would make the iPhone more attractive to users and profitable for Apple.

169. Accordingly, the absence of cross-platform digital wallets with tap-to-pay capability on the iPhone makes it harder for iPhone users to purchase a different Smartphone.

170. The most important function for attracting users to a digital wallet for Smartphones is the ability to offer tap-to-pay, i.e., the ability to make in-person payments by tapping your Smartphone on a payment terminal. Apple uses its control over app creation and API access to selectively prohibit developers from accessing the NFC hardware needed to provide tap-to-pay through a digital wallet app.

171. Apple Wallet is the only app on the iPhone that can use NFC to facilitate tap-to-pay. While Apple actively encourages banks, merchants, and other parties to participate in Apple Wallet, Apple simultaneously exerts its Smartphone monopoly to block these same partners from developing better payment products and services for iPhone users.

172. Apple also uses its Smartphone monopoly to extract payments from banks, which need to access customers that use digital wallets on iPhones. Since Apple first launched Apple

Pay—long before it achieved meaningful adoption—Apple has charged issuing banks fifteen basis points (0.15 percent) for each credit card transaction mediated by Apple Pay. Payment apps from Samsung and Google are free to issuing banks. Apple’s fees are a significant expense for issuing banks and cut into funding for features and benefits that banks might otherwise offer Smartphone users. The volume of impacted transactions is large and growing. A U.S. Consumer Financial Protection Bureau report estimates that Apple Pay facilitated nearly \$200 billion in transactions in the United States in 2022. And the report goes on to explain that “analysts estimate that the value of digital wallet tap-to-pay transactions will grow by over 150 percent by 2028.”

173. Multiple app developers have sought direct NFC access for their payment or wallet apps. Yet Apple prohibits these developers from incorporating tap-to-pay functionality in their apps for fear that doing so would ultimately undermine Apple’s Smartphone monopoly.

174. There is no technical limitation on providing NFC access to developers seeking to offer third-party wallets. For example, Apple allows merchants to use the iPhone’s NFC antenna to accept tap-to-pay payments from consumers. Apple also acknowledges it is technically feasible to enable an iPhone user to set another app (e.g., a bank’s app) as the default payment app, and Apple intends to allow this functionality in Europe.

175. Apple further impedes the adoption of digital wallets by restricting others from offering the same ability to authenticate digital payment options on online checkout pages. By limiting the ability of third-party wallets to provide a simple, fast, and comprehensive solution to online purchasing, Apple further undermines the viability of such wallets.

176. Apple also blocks other digital wallets from serving as an alternative to Apple’s IAP. This prevents these wallets from increasing their attractiveness and improving the overall

user experience on the iPhone by offering consumer experiences that may include use of rewards points in purchasing, digital receipts, returns, loyalty programs, and digital coupons for purchases of relevant subscriptions and digital goods. Apple even prohibits developers on its App Store from notifying users in the developer's app that cheaper prices for services are available using alternative digital wallets or direct payments.

177. Apple's conduct reflects its knowing degradation of the experience of its own users by blocking them from accessing wallets that would have better features. In so doing, Apple cements reliance on the iPhone and also imposes fees on a large and critical slice of all digital wallet NFC transactions, which the U.S. Consumer Financial Protection Bureau estimates will grow to \$451 billion by 2028.

3. Apple's "moat" around its Smartphone monopoly is wide and deep: it uses a similar playbook to maintain its monopoly through many other products and services

178. The exclusionary and anticompetitive acts described above are part of Apple's ongoing course of conduct to build and maintain its Smartphone monopoly. They are hardly exhaustive. Rather, they exemplify the innovation Apple has stifled and Apple's overall strategy of using its power over app distribution and app creation to selectively block threatening innovations.

179. Apple has deployed a similar playbook for a much broader range of third-party apps and services as well, many of which present technologies that function as middleware, facilitate switching, reduce the need for expensive hardware, or disintermediate Apple's iPhone by enabling the development of cross-platform technologies. For instance, Apple has undermined third-party location trackable devices that fully function across platforms. Apple has impaired third-party, cross-platform video communications apps while steering users to its own video communication app, FaceTime. Apple has limited the capabilities of third-party iOS

web browsers, including by requiring that they use Apple’s browser engine, WebKit. Protocols Apple has placed around new “eSIM” technology may introduce additional frictions for any user who seeks to transition from an iPhone to a different phone while maintaining the same phone number. Apple has impeded cross-platform cloud storage apps in order to steer iPhone users into iCloud, making data transfer between different devices more difficult. Apple uses restrictions in sales channels to impede the sale and distribution of rival Smartphones. And Apple has worsened its users’ experience by making it difficult for iPhone users to use superior voice and AI assistants and steering users to use Siri as a voice assistant.

180. Ultimately, the strategies Apple has employed to date are not the only ones Apple can use to achieve its anticompetitive and lucrative ends. As technology evolves, Apple continues to evolve and shift its anticompetitive behavior to protect its monopoly power.

181. For example, in recent years, Apple has increasingly moved into offering its own subscription services, including news, games, video, music, cloud storage, and fitness subscriptions that could be used to keep users tethered to the platform. These subscription services and other ancillary fees are a significant part of Apple’s net revenue. These subscriptions services can also increase switching costs among iPhone users. If an Apple user can only access their subscription service on an iPhone, they may experience significant costs, time, lost content, and other frictions if they attempt to switch to a non-Apple Smartphone or subscription service.

182. These subscription services can also increase Apple’s power over content creators and newspapers, among others, by exerting control over how audiences access their work, decreasing traffic to their websites and apps, and positioning Apple as the intermediary or tollbooth operator in the relationship between creators and users. In so doing, Apple takes on

outsized importance and control in the creative economy, which may diminish incentives to fund, make, and distribute artistic expression.

183. In addition, when one road is closed to Apple, Apple has demonstrated its ability to find new roads to the same or worse ends. For example, Apple was recently ordered to stop blocking link-outs by third parties to their websites where users could buy the third party's product cheaper. In response, Apple reportedly allowed link-outs to websites but now charges for purchases made on the web even if they are not an immediate result of a click from a link in a native iPhone app.

184. Apple has also attempted to undermine cross-platform technologies like digital car keys in ways that benefit Apple but harm consumers. For example, Apple has required developers to add digital keys developed for their own apps to Apple Wallet as well. The default status of Apple Wallet steers users to the Apple Wallet rather than allowing third parties to present digital car keys only in their own cross-platform app, increasing dependence on Apple and the iPhone whenever they use their car. At the same time, it decreases the incentives of automakers to innovate because automakers are forced to share data with Apple and prevented from differentiating themselves as they could absent Apple's conduct.

185. Apple's threatened dominance over the automotive industry goes well beyond the Apple Wallet and Apple's demands on car makers to allow innovative products and services on the iPhone. Apple's Smartphone dominance extends to CarPlay, an Apple infotainment system that enables a car's central display to serve as a display for the iPhone and enables the driver to use the iPhone to control maps and entertainment in the car. Like the Smartphone market, infotainment systems are increasingly considered must-have capabilities in newer vehicles. After leveraging its Smartphone dominance to car infotainment systems, Apple has told

automakers that the next generation of Apple CarPlay will take over all of the screens, sensors, and gauges in a car, forcing users to experience driving as an iPhone-centric experience if they want to use any of the features provided by CarPlay. Here too, Apple leverages its iPhone user base to exert more power over its trading partners, including American carmakers, in future innovation. By applying the same playbook of restrictions to CarPlay, Apple further locks-in the power of the iPhone by preventing the development of other disintermediating technologies that interoperate with the phone but reside off device.

E. Anticompetitive Effects

1. Apple's anticompetitive conduct harms the competitive process and injured consumers

186. As described above, Apple protects its monopoly power in Smartphones and Performance Smartphones by using its control over app distribution and app creation to suppress or delay apps, innovations, and technologies that would reduce user switching costs or simply allow users to discover, purchase, and use their own apps and content without having to rely on Apple.

187. As a result, Apple faces less competition from rival Smartphones and less competitive pressure from innovative, cross-platform technologies not because Apple makes its own products better but because it makes other products worse. With the benefit of less competition, Apple extracts extraordinary profits and regulates innovation to serve its interests.

188. This leaves all Smartphone users worse off, with fewer choices, higher prices and fees, lower quality Smartphones, apps, and accessories, and less innovation from Apple and others. Left unchallenged, Apple will continue to use and strengthen its Smartphone monopoly to dictate how companies can create and distribute apps in the future so that they cannot threaten Apple's Smartphone monopolies.

189. Apple's conduct also has resulted in less choice for Smartphone users. Today, only two companies (Google and Samsung) remain as meaningful competitors to Apple in the premium Smartphone market.

190. Even when users consider these alternatives, Apple's conduct has increased the technical, behavioral, monetary, and other costs of switching from an iPhone to an alternative Smartphone. This undermines competition and entrenches Apple's monopoly power.

191. For example, according to user surveys, one of the biggest reasons iPhone users do not switch to rival Smartphones today is to avoid the problems Apple has created for cross-platform messaging. Likewise, Apple exercised its control over app distribution and app creation to impede the development and growth of super apps, depriving users of technology that would have facilitated switching by decreasing user's dependence on Apple and the iPhone. Apple took a similar approach to cloud streaming apps, delaying, or suppressing technology that would have made it easier for users to switch to cheaper Smartphones. Apple also used its control over app creation, including its control over critical APIs, to impose technical and contractual restrictions on messaging apps, third-party smartwatches, and digital wallets, undermining cross-platform technologies that would have helped users overcome switching costs and friction and ultimately increased Smartphone competition.

192. Apple's conduct has delayed or suppressed the emergence of cross-platform technologies that would put competitive pressure on Apple's ability to extract extraordinary profits from users and developers. For example, if developers could distribute their programs through super apps or cloud streaming apps, rather than the App Store, it would put competitive pressure on Apple's ability to control app distribution and app creation as well as the taxes Apple imposes on developers who want to distribute apps to iPhone users. Similarly, third-party digital

wallets, or other apps with tap-to-pay functionality, would benefit users and developers by putting more competitive pressure on Apple as well. For example, digital wallets could eventually provide developers an alternative way to process payments and manage customer relationships, forcing Apple to compete more aggressively by lowering fees and improving quality, which would ultimately benefit users. Instead, Apple continues to exert its power over customers and financial institutions when users pay for something with their phone—in the App Store, in an app, or increasingly in the physical world with tap-to-pay.

193. Apple's conduct has harmed users in other ways. For example, third-party digital wallets would reduce Apple's ability to charge banks high fees when users make payments using Apple Wallet, which ultimately cost consumers through higher prices or other reductions in quality. Alternative digital wallets could also provide Smartphone users better rewards, e.g., cash back, as well as a more private, secure payment experience from a user's preferred financial institution rather than being forced to go through Apple. But these tap-to-pay digital wallet products and services do not exist today because of Apple.

194. Apple's conduct has made its own products worse, sacrificing the short-term profits Apple could earn from improving the iPhone in order to preserve the long-term value of maintaining its monopoly. In a competitive market, Apple would compete aggressively to support the development of popular apps and accessories for iPhone users, which would in turn make iPhones more attractive to users and more valuable. But Apple takes steps to delay or suppress cross-platform technologies that it recognizes would be popular with users, such as super apps and cloud streaming apps, because of the threat they pose to Apple's Smartphone monopolies. As a result, several developers have abandoned plans to develop super apps and cloud-based gaming apps even after making substantial investments in bringing them to market.

Apple's conduct may have also slowed the development of innovative, high-compute apps related to education, artificial intelligence, and productivity as well. Apple has also impeded innovation by third-party smartwatches such that manufacturers have limited the functionality of their smartwatches for iPhone users, suspended support for iPhone compatibility because of Apple's restrictions, or canceled development of cross-platform smartwatches altogether. At least one company's canceled smartwatch formed part of its overall wearables strategy, including future development of virtual-reality technology. Similarly, Apple degrades third-party messaging apps, even though it makes cross-platform messaging less private and less secure for iPhone users, because doing so raises switching costs.

195. Apple's conduct has harmed other Smartphone users, too. Because of the resources and risks required to maintain different features across different Smartphones, many potential super app, mini program, and other developers do not implement features prohibited by Apple even on other Smartphones. For example, prospective digital wallet providers, including U.S. banks have abandoned the development of digital-wallet apps for either Apple or other Smartphones. Another company decided not to offer users an innovative digital car key in part because Apple required that company to add any features related to the key into Apple Wallet rather than allowing that company to put its key solely in its own app. Other developers have shrunk, shuttered, or abandoned plans to launch super apps, cloud-streamed gaming apps, smartwatches, and other apps. As a result, all Smartphone users enjoy lower quality Smartphones, less innovation, and less choice.

196. Apple is motivated by the anticompetitive purpose of building or maintaining monopoly power in the relevant markets. For example, Apple sacrificed substantial revenues it could have earned from super apps, mini programs, cloud streaming apps, and other third-party

apps and accessories. In particular, mobile gaming already accounts for a large and growing portion of Apple's revenue. Popular cloud streamed gaming apps would offer iPhone users access to popular services (including games) and in turn generate significant revenue for Apple through subscriptions and in-app purchases.

197. Instead, Apple preferred the long-term benefit of reduced Smartphone competition to the revenue it would generate from cloud gaming, super apps, and mini programs or the quality (and consumer demand) increase that would flow from this innovation. Apple has also used its control over app distribution and app creation to selectively undermine cross-platform technologies, not because this helps protect users but because it helps protect Apple.

198. The harms to Smartphone competition caused by Apple's conduct are amplified by Apple's decision to grant itself exclusive distribution rights to iPhone users through the Apple App Store. If Apple allowed users to access apps in other ways, users could choose an app store that did not restrict super apps or mini programs, even if Apple ran its App Store the same way it does today. Apple does not allow that choice, however, because if it did developers could write their programs for any Smartphone rather than specifically for iOS, just as internet browsers and Apple's QuickTime allowed developers to write programs that worked on a variety of operating systems not just Windows. That would lower users' switching costs and reduce users' and developers' dependence on Apple and the iPhone.

199. Apple's Smartphone monopoly gives it many levers to maintain its power even in the face of interventions focused on eliminating or disciplining specific anticompetitive practices. This is because Apple's iPhone monopoly, secured by its anticompetitive conduct, grants it the power to set the rules by which most Smartphone users buy digital and hardware products, and by which developers are allowed to sell these same products to users. If Apple is

forced to change some of these rules, it has the power to adopt new rules, restrictions, or features that reinforce Apple's monopoly and harm competition in other ways. For example, Apple has stated plans to adopt RCS due to market and international regulatory pressure. But Apple continues to contractually restrict third parties from accessing other APIs and features that would enable cross-platform messaging apps. In another instance, Apple was enjoined from enforcing certain anti-steering provisions in its agreements with developers. In response, Apple simply created a different set of onerous restrictions on app developers to achieve a similar result. In other cases, Apple has used its control over app distribution to force companies to comply with Apple's policies that may contradict local laws by delaying the review of the offending companies' apps.

2. Apple has every incentive to continue to abuse its monopoly power absent court intervention.

200. Apple's conduct does not just impact the past and present but poses significant risk to the development of new innovations. Apple may use its Smartphone monopoly playbook to acquire or maintain power over next-frontier devices and technologies. As Apple grows its dominance, Apple may continue delaying or stifling the innovations of cross-platform companies, in order to lock users into Apple devices.

201. Apple has countless products and services—AirPods, iPads, Music, Apple TV, photos, maps, iTunes, CarPlay, AirDrop, Apple Card, and Cash. These provide future avenues for Apple to engage in anticompetitive conduct and the ability to circumvent remedies. Appropriate forward-looking remedies are necessary to ensure that Apple cannot use these products and services to further entrench its monopoly power.

202. Apple's conduct extends beyond just monopoly profits and even affects the flow of speech. For example, Apple is rapidly expanding its role as a TV and movie producer and has

exercised that role to control content.

203. Apple has also attempted to use its monopoly to collect user data and stifle innovation in the automotive industry by, among other things, impeding the development of digital key technologies by requiring them to be offered in Apple's proprietary wallet product and creating new single points of power over emerging uses of the iPhone. These acts further reinforce Apple's power in the iPhone by locking in Apple's services and excluding other alternative technologies that have the potential to disintermediate Apple's iPhone.

204. Finally, Apple's monopolization of Smartphone markets gives it tremendous power over the lives of millions of Americans. Today, Apple uses that power to undermine rival Smartphones, suppress innovative technologies, and stymie consumer choice. Tomorrow, Apple may use its power to force its own users (and their data) to become its next profitable product.

3. There are no procompetitive benefits to Apple's anticompetitive conduct

205. There are no legitimate procompetitive benefits of Apple's exclusionary conduct that would outweigh its anticompetitive effects. Apple's moat building has not resulted in lower prices, higher output, improved innovation, or a better user experience for Smartphone users.

206. Apple markets itself on the basis of privacy and security to differentiate itself from what competition is left in the Smartphone market. But this does not justify Apple's monopolistic and anticompetitive conduct. Apple imposes contractual restraints on app creation and distribution, imposes hefty fees on many types of Smartphone interactions, and conditionally restricts API access on its Smartphone platform simply because it can. There are limited if any competitive constraints on this conduct. As a point of comparison, Apple does not engage in such conduct on its Mac laptops and computers. It gives developers the freedom to distribute software directly to consumers on Mac without going through an Apple-controlled app store and

without paying Apple app store fees. This still provides a safe and secure experience for Mac users, demonstrating that Apple's control over app distribution and creation on the iPhone is substantially more restrictive than necessary to protect user privacy and security.

207. In fact, many alternative technologies that Apple's conduct suppresses would enhance user security and privacy. For example, Apple's conduct targeting digital wallets forces users to share information with Apple even if they would prefer to share that information solely with their bank, medical provider, or other trusted third party. In particular, when an iPhone user provisions a credit or debit card into Apple Wallet, Apple intervenes in a process that could otherwise occur directly between the user and card issuer introducing an additional point of failure for privacy and security. Likewise, super apps or alternative app stores could offer users and their families a more curated selection of apps that better protect user privacy and security. Indeed, Apple allows enterprise and public sector customers to offer more curated app stores on employee iPhones because it better protects privacy and security.

208. Apple is also willing to make the iPhone less secure and less private if that helps maintain its monopoly power. For example, text messages sent from iPhones to Android phones are unencrypted as a result of Apple's conduct. If Apple wanted to, Apple could allow iPhone users to send encrypted messages to Android users while still using iMessage on their iPhone, which would instantly improve the privacy and security of iPhone and other Smartphone users.

209. Similarly, Apple is willing to sacrifice user privacy and security in other ways so long as doing so benefits Apple. For example, Apple allows developers to distribute apps through its App Store that collect vast amounts of personal and sensitive data about users—including children—at the expense of its users' privacy and security. Apple also enters agreements to share in the revenue generated from advertising that relies on harvesting users'

personal data. For example, Apple accepts massive payments from Google to set its search engine as the default in the Safari web browser even though Apple recognizes that other search engines better protect user privacy.

210. Finally, Apple selectively enforces its rules and contractual restrictions for app distribution and app creation. For example, when it benefits Apple to do so, Apple permits developers to introduce mini programs, stream content from the cloud, use virtual currency, and receive special permissions or access APIs not automatically available to everyone.

211. Ultimately, Apple chooses to make the iPhone private and secure when doing so benefits Apple; Apple chooses alternative courses when those courses help Apple protect its monopoly power. Apple's conduct underscores the pretextual nature of any claim that Apple's conduct is justified by protecting user privacy or security.

V. CLASS ACTION ALLEGATIONS

212. Plaintiff brings this action on behalf of herself, and, under Rules 23(a) and (b) of the Federal Rules of Civil Procedure, on behalf of the following Class:

All persons that purchased a new iPhone directly from Apple, for end use and not for re-sale, in the United States during the Class Period.

213. "Class Period" means the period from at least as early as March 21, 2020, through the date by which the anticompetitive effects of the conduct shall have ceased, but in any event no later than the present.

214. Excluded from the Class are Defendant and its respective officers, directors, management, employees, subsidiaries, and affiliates. Also excluded is the Judge presiding over this action, his or her law clerks, spouse, and any person within the third degree of relationship living in the Judge's household and the spouse of such a person.

215. Members of the Class are so numerous and geographically dispersed that joinder

is impracticable. Further, members of the Class are readily identifiable from information and records in the possession of Defendant.

216. Plaintiff's claims are typical of the claims of the members of the Class. Plaintiff and members of the Class were damaged by the same wrongful conduct of Defendant.

217. Plaintiff's will fairly and adequately protect and represent the interests of members of the Class. The interests of the Plaintiff are coincident with, and not antagonistic to, those of members of the Class.

218. Plaintiff is represented by counsel with experience in the prosecution and leadership of class action antitrust and other complex litigation, including class actions in the financial services industry, having brought successful claims against the same Defendant named herein.

219. Questions of law and fact common to the members of the Class predominate over questions that may affect only individual members of the Class, thereby making damages with respect to members of the Class as a whole appropriate.

220. Questions of law and fact common to members of the Class include, but are not limited to:

- a. Whether Defendant monopolized or attempted to monopolize the Relevant Markets in violation of federal law;
- b. Damages suffered by Plaintiff and members of the Class;
- c. Market definition;
- d. Monopoly power;
- e. Whether Defendant acted or refused to act on grounds generally applicable to members of the Class, thereby making appropriate final injunctive relief or corresponding declaratory relief with respect to members of the Class as a whole.

221. Class action treatment is a superior method for the fair and efficient adjudication

of the controversy. Such treatment will permit a large number of similarly situated persons to prosecute their common claims in a single forum simultaneously, efficiently and without the unnecessary duplication of evidence, effort, or expense that numerous individual actions would require.

222. The benefits of proceeding through the class mechanism, including providing injured persons or entities a method for obtaining redress on claims that could not practicably be pursued individually, substantially outweighs potential difficulties in management of this class action.

223. Plaintiff knows of no special difficulty to be encountered in the maintenance of this action that would preclude its maintenance as a class action.

224. Plaintiff has defined members of the Class based on currently available information and hereby reserve the right to amend the definition of members of the Class, including, without limitation, the Class Period.

VI. CLAIMS FOR RELIEF

COUNT I: MONOPOLIZATION

Section 2 of the Sherman Antitrust Act 15 U.S.C. § 2

225. Plaintiff incorporates by reference and re-allege the preceding allegations as though fully set forth herein.

226. The market for the sale of Performance Smartphones and Smartphones, respectively, are Relevant Product Markets.

227. The United States is the Relevant Geographic Market for each Relevant Product Market.

228. During the Class Period, Defendant has enjoyed monopoly power in the Relevant

Markets. Apple has the power to control prices or exclude competition in the Relevant Markets. Apple's U.S. market share by revenue is over 70 percent in the Performance Smartphone market and over 65 percent for all Smartphones. Over the last decade, Apple collected more than half the revenue for all Smartphones sold in the United States. This market share and other market information alleged above show Apple's monopoly power.

229. Apple has, in fact, controlled prices and excluded competition, in the Relevant Markets during the Class Period. These demonstrable anticompetitive effects themselves also show Apple's monopoly power.

230. During the Class Period, Defendant has monopolized the Relevant Market by engaging in unlawful, interconnected, and mutually reinforcing anticompetitive and exclusionary acts, as alleged herein, which have injured and continue to injure competition, and for which there is no offsetting procompetitive justification.

231. Apple charged, and Plaintiff and members of the Class paid, supracompetitive prices for Relevant Products, as a direct and proximate result of Apple's monopolization of the Relevant Market.

232. Plaintiff and members of the Class have been injured in their business and property by reason of Defendant's violation of Section 2 of the Sherman Act, within the meaning of Section 4 of the Clayton Antitrust Act, 15 U.S.C. §15.

233. Plaintiff and members of the Class are threatened with future injury to their business and property by reason of Defendant's continuing violation of Section 2 of the Sherman Act, within the meaning of Section 16 of the Clayton Antitrust Act, 15 U.S.C. §26.

**COUNT II:
ATTEMPTED MONOPOLIZATION**

**Section 2 of the Sherman Antitrust Act
15 U.S.C. § 2**

234. Plaintiff incorporates by reference and re-allege the preceding allegations as though fully set forth herein.

235. The market for the sale of Performance Smartphones and Smartphones, respectively, are Relevant Product Markets.

236. The United States is the Relevant Geographic Market for each Relevant Product Market.

237. During the Class Period, Defendant has enjoyed monopoly power in the Relevant Markets. Apple has the power to control prices or exclude competition in the Relevant Markets. Apple's U.S. market share by revenue is over 70 percent in the Performance Smartphone market and over 65 percent for all Smartphones. Over the last decade, Apple collected more than half the revenue for all Smartphones sold in the United States. This market share and other market information alleged above show Apple's monopoly power.

238. Apple has, in fact, controlled prices and excluded competition, in the Relevant Markets during the Class Period. These demonstrable anticompetitive effects themselves also show Apple's monopoly power.

239. During the Class Period, Defendant attempted to monopolize the Relevant Market by engaging in unlawful, interconnected, and mutually reinforcing anticompetitive and exclusionary acts, as alleged herein, which have injured and continue to injure competition, and for which there is no offsetting procompetitive justification.

240. Apple acted with the specific intent to monopolize the Relevant Market.

241. Apple charged, and Plaintiff and members of the Class paid, supracompetitive

prices for Relevant Products, as a direct and proximate result of Apple's attempted monopolization of the Relevant Market.

242. Plaintiff and members of the Class have been injured in their business and property by reason of Defendant's violation of Section 2 of the Sherman Act, within the meaning of Section 4 of the Clayton Antitrust Act, 15 U.S.C. §15.

243. Plaintiff and members of the Class are threatened with future injury to their business and property by reason of Defendant's continuing violation of Section 2 of the Sherman Act, within the meaning of Section 16 of the Clayton Antitrust Act, 15 U.S.C. §26.

VII. PRAYER FOR RELIEF

WHEREFORE, Plaintiff, on behalf of herself and members of the Class, respectfully prays that This Honorable Court:

A. Order that this action may be maintained as a class action pursuant to Rules 23(a) & (b) of the Federal Rules of Civil Procedure, that she be named a Class Representative, that the undersigned be named Lead Class Counsel, and that reasonable notice of this action, as provided by Rule 23(c)(2), be given to members of the Class;

B. Adjudge that Defendant violated federal antitrust laws, as set forth above;

C. Award Plaintiff and members of the Class treble damages; attorneys' fees and costs of suit, including costs of consulting and testifying experts; and pre- and post-judgment interest;

F. Enjoin Defendant from its continuing violations of federal and state law;

G. Grant prospective injunctive relief, including structural relief, to prevent and restrain any future violations of law;

H. Grant such other, further, and different relief as may be just and proper.

VIII. DEMAND FOR JURY TRIAL

Under Rule 38(b) of the Federal Rules of Civil Procedure, Plaintiff demands a Trial by Jury as to all issues so triable.
